Energy Wave

CONFIDENTIAL — DRAFT — FOR DISCUSSION

Credibility before capital. The rules this package holds itself to.

A century of this field is littered with frauds and self-deception. The company rejects far more than it pursues, and it labels everything it keeps. These are the rules; a reader who finds a page breaking one of them has found a defect, and we would like to hear about it.

1 · THE TWO-QUESTION FILTER

> **Is there a net source? Is there a colder sink?** A claim that cannot answer both is not advanced, promoted or funded — it is documented and set down. This is the instrument that caught a fraudulent vendor during the company's own diligence in 2025.

2 · SIX LABELS FOR EVERY THIRD-PARTY RESULT

Label	Meaning	Example in this package
Established	Confirmed physics, measured to high precision, textbook.	The Casimir effect (Lamoreaux 1997; Mohideen & Roy 1998); the Lamb shift; the dynamical Casimir effect, whose photons are paid for by the pump (Wilson et al. 2011).
Observed	Reproducible engineering of a known effect.	Casimir forces reduced by nanostructuring, reversed in fluids, given a stable equilibrium, tuned magnetically.
Proposed	Exists on paper only.	Forward 1984 — a one-shot, rechargeable "battery" by its author's own description.
Claimed, not replicated	One laboratory, no independent confirmation.	Moddel et al. 2021: an unexplained current, 1.4 pW maximum, >1,000 devices, one lab.
Disputed	A published critique contests the mechanism.	Maclay 2024 argues the proposed mechanism predicts the opposite sign.
Company claim	A vendor's statement without peer-reviewed data.	Casimir Inc. "MicroSparc" (May 2026): ~40 µW company claim, no device data.

3 · NUMBERS

No watt, efficiency, runtime or performance figure is attributed to an EnergyWave device anywhere in this package: no verified company performance figure is supplied, and no EnergyWave measurement exists in the reviewed evidence. Every number carries its origin: **assumption · calculation · proposed target · company measurement · attributed published result**. A superlative is a claim that needs a citation instead.

4 · THE BOUNDARY THE PROGRAM IS BUILT TO TEST

Legitimate adjacent science — the Casimir effect, the Lamb shift, metamaterials and nanofabrication, ion-wind and field propulsion — is kept explicitly separate from the contested leap: continuous net extraction of energy from the vacuum, which the rigorous reviews say would violate the second law of thermodynamics, and whose

kilowatt figures in the literature are unbuilt theoretical estimates. The line between the two is exactly where the company does its work.

5 · PUBLISH IN BOTH DIRECTIONS

If a gate kills an effect, the company says so, in public, with the error budget attached. A retired claim is a deliverable. Investors read the same report the public does.

6 · WHAT STAYS OUT OF PUBLIC AND GOVERNMENT-FACING MATERIAL UNTIL CLEARED

A patent number; a device performance specification; any statement that a device exists; any person's name without their written consent; any concept not yet defined, sourced and tested against the two-question standard.

> **A note on the October 2026 materials.** The deck and one-pager of 13 October name the first research module (Floyd Sweet's solid-state design), name the advisors, and use the line "the power supply for humanoid robots." The company's September 2026 charter had barred all three pending consents and gate results. Which rule set governs going forward is **[TBD]** (founder, 15 Oct 2026: keep format and content as they are; no further question is asked) — a direction about format, not a repeal of the evidence standards above. Until determined, the Oct-13 positioning stands as the approved materials and this page records the difference rather than hiding it. `[TBD] — D10`
